

InfiniTea App Summary Report

We made this simple overview of our InfiniTea app project. We built an Android bubble tea ordering app using what we learned from our Software Engineering course. Each screen below shows a different part of the app and what it does.

This is the home screen where users can start an order, view the cart, or check past orders.

This is the menu page with all classic milk teas. The users can pick from the preset drinks. There's also an option to build your own.

M: \$6.00
L: \$6.75

Black Bubble Milk Tea

A rich black tea with chewy tapioca pearls.
[BUBBLES]

Rose Bubble Milk Tea

Floral rose tea blended with milk and chewy
tapioca pearls.[BUBBLES]

Thai Bubble Milk Tea

Creamy Thai tea with a bold flavor and chewy
tapioca pearls.[BUBBLES]

Jasmine Bubble Milk Tea

Light and fragrant jasmine green tea with chewy
tapioca pearls.[BUBBLES]

ADD TO CART

This is the 'Build Your Own' drink page. Users can customize a drink by tapping the “make your drink” button.

This pop-up lets users choose tea base, size, sugar, ice, and quantity before adding the drink.

After picking toppings (up to 3), the price updates in real-time.

There are two past orders on the “My Orders” page. Users can scroll down to see more details. They can also print the receipt or delete any order from the past order list.

For this project, we used a lot of ideas from our Software Engineering class. We followed object-oriented design by creating classes like MilkTea, Order, MyOrder, Topping, and TeaBase, etc., to keep our code organized and easy to update. Every class and screen (Activity) had one clear job - for example, MyOrdersActivity manages past orders, while BuildYourOwnActivity handles custom drink creation.

We broke the app into different parts like preset drinks (ChooseDrinkActivity), custom drinks (BuildYourOwnActivity), the shopping cart (ShoppingCartActivity), and order history (MyOrdersActivity). This modular structure made it easier to develop and test each piece separately.

To ensure our app looked and felt good, we followed Material Design guidelines for the layout, buttons, and overall UI. We also included user feedback and error handling - for example, if someone tries to add more than three toppings, the app stops them and shows a warning message.

We wrote unit tests and used Espresso tests to ensure everything worked as expected. The code is easy to reuse and extend because we used adapters like MenuAdapter and OrderAdapter, as well as helper classes like OrderFilter and ReorderCartManage, to keep things organized.

For teamwork, we used Git for version control, Discord to communicate and share feedback, and Google Drive/Docs to plan, share files, and document ideas. Each teammate worked on different parts - UI, backend logic, or testing - and we did code reviews to keep everything running smoothly. It was a great way to turn classroom ideas into a real, working app.
